Iridium was originally found as a contaminant (with the element osmium) by K. S. Martin and G. N. S. R. Baker in 1803. It was first identified as a distinct element by Robert Bunsen and Gustav Kirchhoff in 1861. Iridium is a hard, brittle, silvery-white metal that is highly resistant to corrosion. It is one of the most corrosion-resistant elements, being able to withstand aqua regia, a mixture of nitric and hydrochloric acids. Iridium is used in high-temperature catalytic converters, in the tips of surgical instruments, and in the electrical contacts of spark plugs. It is also used in the production of iridium chloride, a pigment used in the manufacture of blue pigments for pigments and dyes.
